

Introduction

Rayzer's **Polarization Beam Splitter / Combiner (PBS/PBC)** Series products, are designed to either combine two orthogonal polarization into a single fiber or split a single input into its orthogonal linear polarization through two fiber outputs. The most common application is to combine the light of two pump lasers into one single fiber to double the pump power. The typical configuration uses two PM fibers as input and SM fiber as output. The device can also be used as a beam splitter.
